Simple Linear Regression Analysis

Introduction

- In developing a model of an economic phenomenon (e.g., the law of demand) econometricians make heavy use of a statistical technique known as regression analysis. The purpose of this section and the next is to introduce the basics of regression analysis in terms of the simplest possible linear regression model, namely, the two-variable model.
- Regression analysis is concerned with the study of the relationship between one variable called the explained, or dependent, variable and one or more other variables called independent, or explanatory, variables.
- Here we will consider the simple linear regression model i.e. two-variable regression model. The PRF for two-variable model can be given as:

$$E(Y_i) = \beta_1 + \beta_2 X_i + u_i \quad (1)$$

Where Y is the dependent variable, X and is the explanatory variables, and u_i is the stochastic disturbance term.

- In the regression model above β_1 is intercept coefficient, which represents the average value of Y when X is set equal to zero.
- β_2 is the slope coefficient. β_2 measures the change in mean value of Y , per unit change in X .
